SECUREPOINT UNIFIED BACKUP

THE VIRTUAL VAULT FOR COMPREHENSIVE DATA PROTECTION

With reliable and frequent data backup, ransomware, system crashes, accidents, or user errors, are no longer a threat.

SECUREPOINT UNIFIED SECURITY

Unified Security means ensuring network security at all levels. Just as in a car, where headrest, seatbelt, and crumple zone work together to achieve maximum safety, individually effective IT security measures combine to form a robust security infrastructure.

Take a comprehensive approach to IT security with Unified Security by Securepoint.

Protecting data

Protect your company data, customer data, project information, and intellectual property with Unified Backup by Securepoint.

Double secured

The backup cloud is georedundant, encrypted, and meets all the requirements of a reliable data backup.

Data backup for the highest standards

With Unified Backup, you can leave tapes and hard drives in the drawer. Automatically back up your data online in the cloud and protect yourself against malfunctions and data loss. From software to hardware, you can trust IT made in Germany: The servers of the cloud service are georedundant and located in German data centers.

Unified Backup securely backs up data from physical or virtual servers and endpoints running on Microsoft or Linux operating systems, as well as hypervisors like VMWare. It also supports application-aware backup of applications such as Microsoft SQL, SharePoint, or Exchange Server.

Efficiently automated

The Unified Backup software automatically backs up all changes at user-defined intervals using DeltaPro technology.

Backup servers in Germany

No data transfer across the ocean, no support from distant call centers, and guaranteed to be free from backdoors.

Backup encryption

To secure your data, all backup contents are encrypted using Advanced Encryption Standard (256-bit AES) before being sent to the cloud. This ensures that espionage, blackmail, or data manipulation between local storage and backup are completely eliminated.

Frequent backup intervals

For regular data backup, you have up to 44 individually configurable backup points available, which can also serve as recovery points. Instead of relying on weekly or monthly backups, this allows you to have up to four backups per day.

In the event of a disaster recovery, you always have access to a complete backup instead of having to combine individual increments

Unified Backup benefits:

- Easy setup and operation via web portal
- Individually configurable backup intervals
- Up to 44 selectable recovery points
- DeltaPro technology reduces unnecessary data traffic through incremental data storage
- Encryption of all data before transmission
- Versatile restore options in case of data loss
- Excellent price-performance ratio
- Clear cost structure
- EU GDPR ready

THE VAULT FOR COMPREHENSIVE DATA PROTECTION

In case of an emergency: Fast disaster recovery

In the event of a critical situation, you need to be able to quickly restore your data. With various restoration options, you can perform backup disaster recovery instantly. The restoration can be tailored to your needs, whether on dedicated hardware or in virtual environments.

Individually automated Backups

Unified Backup automates the backup process of your data up to four times a day, and you can determine the specific intervals. To minimize the amount of data transferred during each backup, incremental backups are performed, meaning only the data that has changed is backed up.

Unified Backup utilizes DeltaPro technology with quick file scanning and efficient data compression, allowing for fast and resource-efficient backups. The incremental backups are based on an initial full backup.

Centralized control of all instances

Securepoint Unified Backup is the ideal tool for offering data backup as a service! There are no costs for hardware or maintenance, and no licensing fees for the software. You only pay for the storage space you use.

After installing the backup software, you can centrally control everything from a location of your choice. You have access to a comprehensive user interface online for configuring backup intervals and conducting regular monitoring. Through this interface, you can keep an eye on all backups of your customers.

With the Unified Backup software, you can easily manage data backup and recovery for various devices, users, or organizations. The user-friendly and intuitive interface of the backup portal allows you to easily plan and execute all tasks for all customers. It provides a clear and easily understandable overview for efficient management of the backup process.
