PROTECTION FOR NETWORKS AND DEVICES

CLOUD SHIELD

SECUREPOINT CLOUD SHIELD

Cloud Shield secures entire networks or individual devices with just a few clicks and offers features that are otherwise only found in UTM firewalls. The secret to its effectiveness: All DNS traffic runs through secure Securepoint servers, where dangerous connections are immediately blocked – keeping Trojans inactive and users away from phishing sites. Since every request is filtered, even smart TVs and network printers are protected.

Security through encrypted connections

For true internet security, Cloud Shield works directly at the domain name system (DNS) level. This is the internet's address database, which translates a web address into a machine address, enabling access to the content of the website or app. Cloud Shield ensures that every address is checked against a constantly updated security database before it is visited. This database stores fake, compromised, or otherwise risky web addresses. If the address is secure, an encrypted connection is established so that no data can be intercepted during transfer.

Cloud Shield provides firewall capabilities for all

Protection against online threats, custom content filters, and rules for geo-IP blocking make Cloud Shield a powerful solution for simple internet security.

- Content categories make it easy to restrict services and websites, e.g., for youth protection in the company. Individual addresses can be approved if necessary.
- Geo-IP blocking blocks connections to selected countries and prevents data leaks and attacks from these regions.

Everything easily online

Secure new devices with Cloud Shield, define Geo-IP blocking, or configure filter settings: there is an easy-to-use online portal for all of this. Here you can activate logging and view statistics on blocked attacks.

Highlights at a glance

- Protection for networks and devices
- DNS check and encrypted connections
- Firewall, filter, and Geo-IP blocking
- Parental controls and blocking functions
- Management via online portal
