CENTRALLY MANAGE MOBILE DEVICES

MOBILE DEVICE MANAGEMENT

FLEXIBLE CONTROL OF MOBILE DEVICES

MOBILE DEVICE MANAGEMENT BY SECUREPOINT.

Manage mobile devices

Device management via the central Securepoint online portal

Control over apps

Restrict or share applications individually and for groups

Modern device management – secure, flexible, and efficient

Managing and securing company cell phones and tablets is a key task for every IT department. With our Mobile Device Management (MDM) for Android and iOS/iPadOS, we offer a new level of efficiency and user-friendliness.

Zero-touch enrollment

Zero-touch enrollment for iOS devices revolutionizes device setup: users, apps, and profiles can be assigned to each device before it is even shipped. Once the hardware has been registered by the reseller in Apple Business Manager (ABM), configuration takes place online. Users receive the smartphone or tablet in its original packaging directly on their desk – the unboxing experience is preserved and the preparation effort is reduced to a minimum.

Secure authentication and quick commissioning

After switching on for the first time, users authenticate themselves securely and conveniently using a PIN. The device then automatically downloads the corresponding profile with all previously defined restrictions and the appropriate apps. No more

time-consuming manual setup — everything runs automatically, securely, and user-friendly.

Seamless integration into existing systems

The current MDM version also allows synchronization of users from the Microsoft cloud (Entra ID). This means that user accounts can be imported directly, further simplifying administration and enabling rapid provisioning of new devices and access.

For Apple and Android

Compatible with current iOS, iPadOS, and Android operating systems

Bring your own device

Enables separate private and professional use of devices (BYOD)

Preconfigure apps – be productive from day one

Whether Outlook, Threema, Zoom, or Slack: many applications shape our everyday working lives. MDM allows these and many other apps to be configured with the appropriate settings before delivery. This means that devices are ready for use straight out of the box—without any additional configuration effort for IT or end users.

Reassign devices flexibly and securely

The MDM has also greatly simplified the process of recommissioning existing devices, for example when there is a change in personnel. Assignment to new users is carried out entirely remotely, without the need to physically touch the end device. This saves time, reduces costs, and minimizes downtime.

Security and control – even if lost

Location and deletion functions help to track down devices if they are lost and to back up or delete the data they contain. This ensures that sensitive information is protected at all times.

When migrating from other MDM systems to Securepoint Mobile Device Management, Apple devices no longer need to be reset.

System requirements

The current system requirements for Securepoint Mobile Device Management (MDM) can be found at:

Unified Endpoint Protection: The ideal combination

Mobile Device Management is part of Unified Endpoint Protection. This solution package provides access to a growing combination of security solutions with a single license. Currently, the license includes the VPN client for Windows devices, Cloud Shield, and Mobile Device Management.

PERFECT FOR SCHOOLS

Making digitization secure and easy

The digitization of school education poses particular challenges: data protection and youth protection must be fully guaranteed, and applications and devices must be easy to manage. Our MDM provides schools with optimal support—with features specially developed for the education sector.

Apple School Manager, Classroom apps, and shared iPads

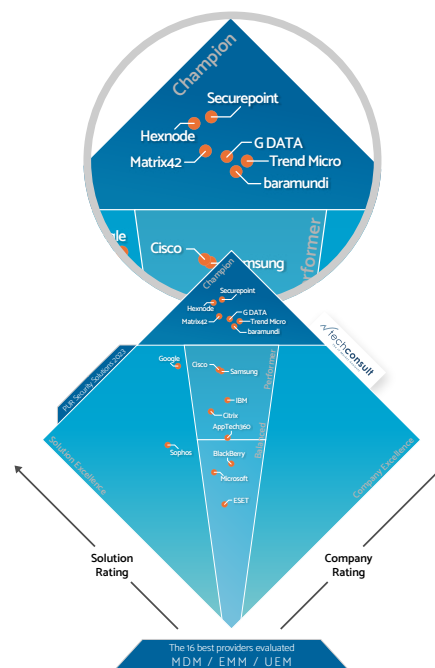

Securepoint MDM supports Apple School Manager, Classroom apps, and shared iPads. This allows teachers and students to easily use their own or shared devices. All settings, permissions, and apps are managed centrally via an intuitive interface—for individual users, specific groups, or the entire school.

Secure administration

New devices can be added easily and intuitively—perfect for growing schools and changing classes. As in business, the same applies in schools: devices can be issued directly to students by the retailer. After entering a PIN, the device configures itself automatically—including all necessary restrictions, filters, and apps. This preserves the unboxing experience and reduces the burden on IT.

Flexible filters and youth protection

MDM enables the creation of location-based profiles that allow for different usage at home and at school—for example, messenger apps may only be used outside of school. This ensures optimal data protection and youth protection.

Excellent solution

Securepoint MDM has been named champion in the “MDM/EMM/UEM” category of the independent techconsult study “Professional User Rating Security Solutions” on multiple occasions.
